Hail Model Shaded by Score Hail 1" or Larger

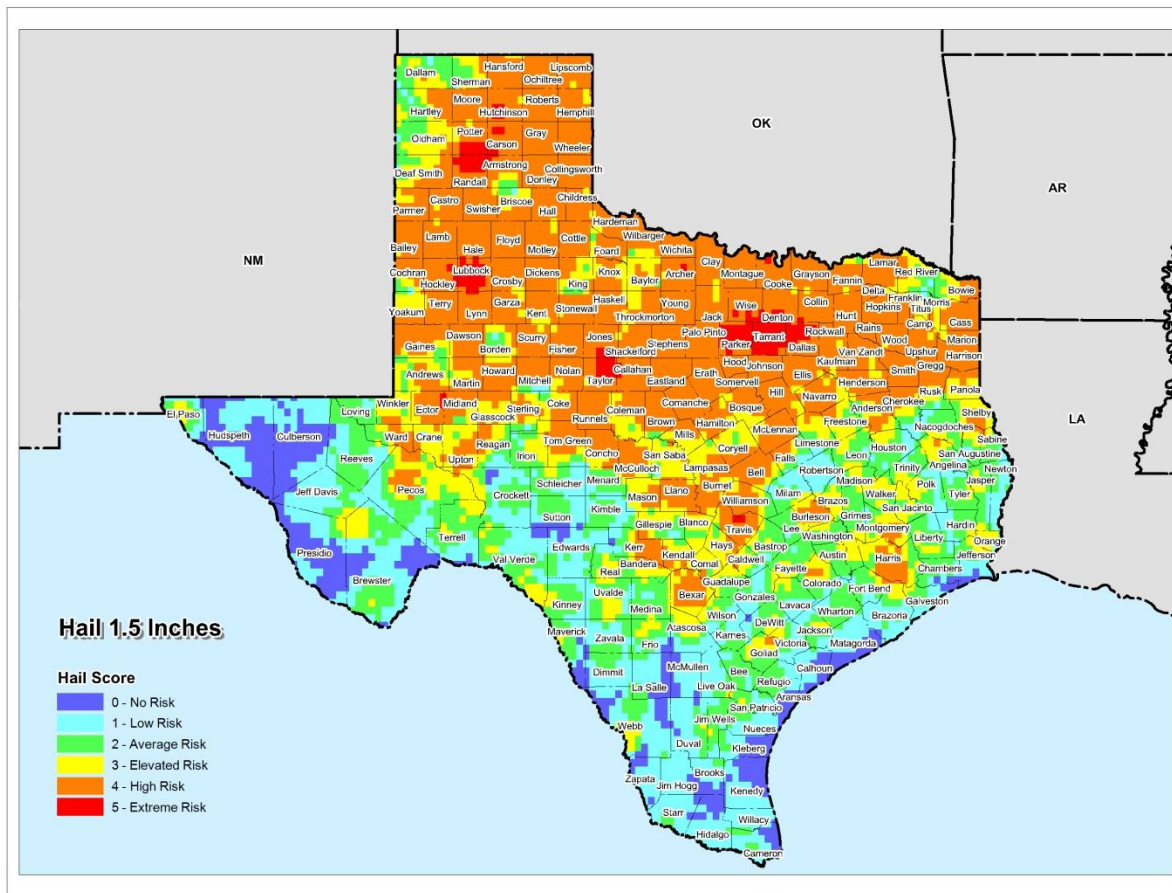

Hail Events by Year

CDS Hail Scores 1" and Larger

CDS Hail Scores 1 ½" and Larger

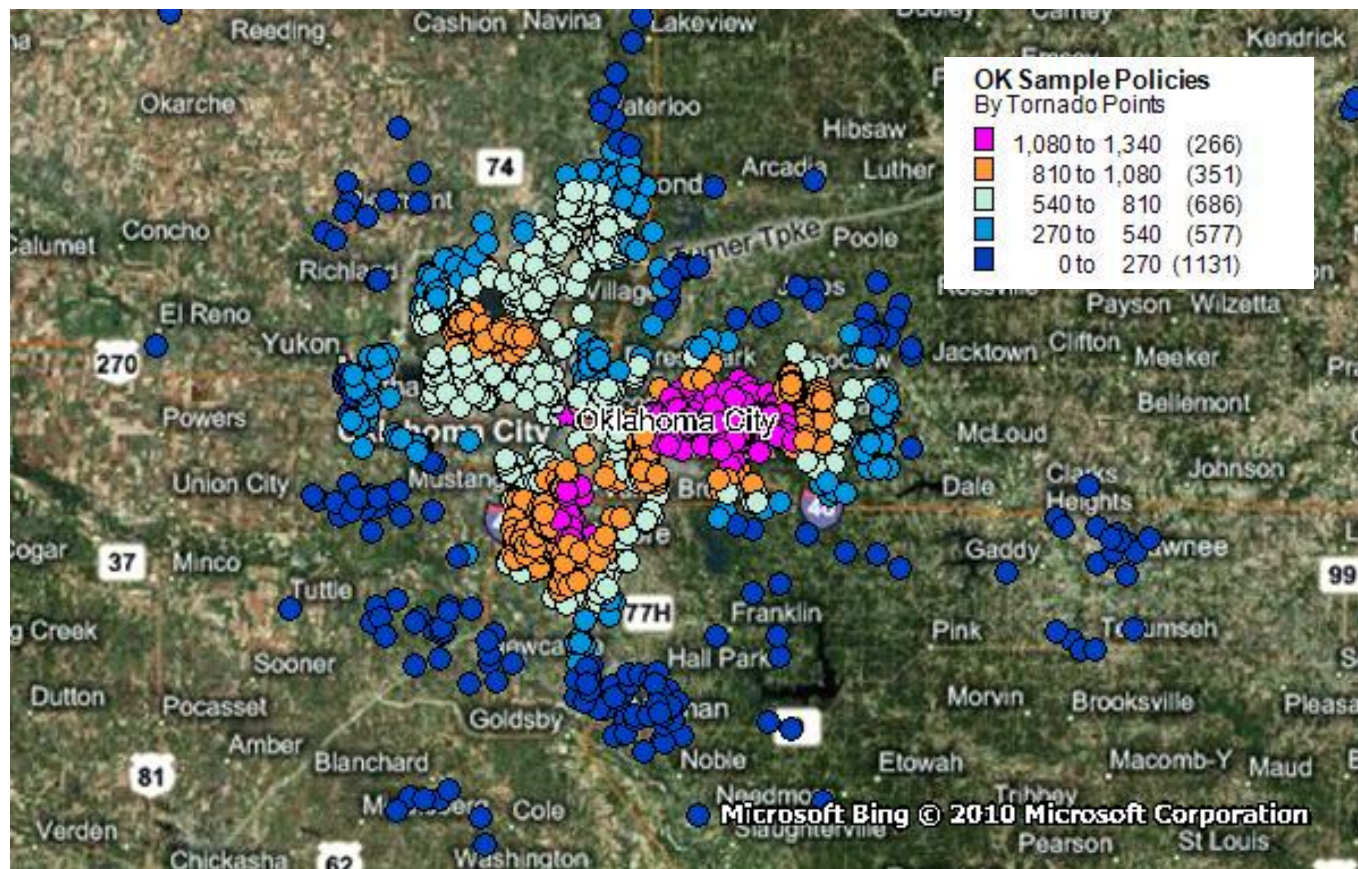

Aggregations

5 mile buffers were created around each policy. The sum total number of “tornado points” around each policy was calculated. So a score of 5 gives 5 points, etc. So its not just counting the policies, its using the scores as well

Policies shaded by Total Points

You can now see the areas with the highest TIV concentrations and the highest tornado scores
